Let's Start!

Cloud Computing Services

Learning Outcome:

Understand information about people's backgrounds in spoken or written documents.

Interpret the IT needs assessment, to determine the required technology to manage information, according to the rules and protocols established by the company.

Ask your partner:

- Do you think cloud computing services are better than traditional software services? Why?
- Are cloud computing services likely to replace other forms of services in the future? Why?

Can Do Statements:

- I can list different kinds of cloud computing services.
- I can talk about different characteristics for cloud computing services.
- I can discuss the differences among public clouds, private clouds, hybrid clouds and managed clouds.

Let's Explore!

The class discusses cloud computing services

Instructions: Read the text below.

Professor: Good morning, class. Today, we'll be talking about cloud computing services. But first, what is understood by a cloud computing service, Sarah?

Sarah: Well, it's basically a provision of technological services in which some functions aren't in a physical room, but over the internet. These services are often outsourced.

Professor: That's right. Cloud services have transformed the way the technology industry works because of its potential to save costs, flexibility and accessibility. Charles, how are cloud services classified?

Charles: These services are classified into three main categories in terms of property. First, there is Software as a Service (SAAS), in which software is made available over a network and it's no longer acquired through licenses. Then we have Infrastructure as a Service (IAAS), which is the rental of IT equipment from a cloud services provider, which replaces the need of owning computers, networks and expensive storage devices. Finally we find Platform as a Service (PAAS), which basically allows users to develop and execute their own applications over an external platform.

Professor: Well summarized, Charles. Sarah, how are these services delivered?

Sarah: Hmm, cloud computing services delivery is divided into four types: public, private, hybrid and managed clouds. A public cloud allows users free access and provides the greatest level of efficiency such as in emails or social networking sites. A private cloud, which is maintained on a private network, for example in a company, is much safer than a public one, and allows companies to reduce costs, saving in infrastructure. A hybrid cloud shares characteristics of both public and private clouds, for example when a company offers content with free access to interact with the public, but at the same time, there are security protocols for restricted data and computing services. Finally, managed clouds, which are like private clouds, but are owned and managed by the customer himself.

Let's Practice!

The cloud computing services.

Instructions: Match column A with column B.

COLUMN A

1. Cloud computing services
2. Software as a Service (SAAS)
3. Infrastructure as a Service (IAAS)
4. Platform as a Service (PAAS)
5. In terms of service delivery, cloud computing services

COLUMN B

- a. are classified into three main categories in terms of property.
- b. is contracted when the user pays a rent for IT equipment.
- c. are divided into four types: public, private, hybrid and managed.
- d. is used when customers want to developed and execute their own applications.
- e. is made available over a network and doesn't need licenses.

Let's Practice!

Why are cloud computing services useful?

Instructions: Select the correct answer to complete the sentence.

1. Cloud computing services delivery is classified into _____ main types.
a. five b. four c. fourteen d. forty
2. Emails and social networks are good examples of public clouds because they are accessed _____.
a. freely b. freedom c. for d. form
3. A cloud that is owned and controlled by the customer or user is a _____ cloud.
a. manager b. maintenance c. master d. managed
4. When certain data are _____, but there is also interaction with the public, a hybrid cloud is required.
a. restricted b. rest c. resist d. reset
5. _____ clouds are used by some companies, when they want their information to be restricted.
a. Public b. Part-time c. Private d. Progressive
6. In order to reduce infrastructure _____, cloud computing services are contracted by most startups.
a. costs b. cuts c. codes d. coders

Extension Activity

Finding what clouds are commonly used.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Find information about 3 companies that use cloud computing services.
- Analyze what the companies do.
- Propose what kind of cloud the companies use.
- Make a chart comparing the information you found.
- Share your work with your classmates.

Self-Assessment

Yes

No

- | | | |
|--|-----------------------|-----------------------|
| 1. I find information about companies that use cloud computing services. | ☐ | ☐ |
| 2. I analyze what the companies do. | ☐ | ☐ |
| 3. I propose the cloud that each company uses. | ☐ | ☐ |
| 4. I make a chart comparing the 3 companies and their clouds. | ☐ | ☐ |
| 5. I share my work with classmates. | ☐ | ☐ |

Target Words

- **physical** (adjective): existing in a physical way that can be seen and touched.
e.g. It's basically a provision of technological services in which some functions aren't in a physical room, but over the internet.
- **potential** (noun): an expected ability or characteristic.
e.g. Cloud services have transformed the way the technology industry works because of its potential to save costs, flexibility and accessibility.
- **flexibility** (noun): the quality of being able to be customized or adapted, depending on the needs or situation.
e.g. Cloud services have transformed the way the technology industry works because of its potential to save costs, flexibility and accessibility.
- **rental** (noun): paying an amount of money for using a service temporarily.
e.g. Infrastructure as a Service (IAAS), which is the rental of IT equipment from a cloud services provider.
- **hybrid** (adjective): a mixture between two or more things.
e.g. A hybrid cloud shares characteristics of both public and private clouds.
- **security protocol** (expression): a system of rules that states what to do under certain circumstances related to data security.
e.g. When a company offers content with free access to interact with the public, but at the same time there are security protocols for restricted data and computing services.

Learning Points

Simple Present Passive in Affirmative Statements and Questions

When we want to emphasize the object of a sentence or when the subject is not important or unknown, we use the **passive voice**.

The **passive voice** is used in the *simple present* to talk about situations that occur on a regular basis. Generally, the doer of the action is unknown or is not relevant. To make the simple present passive in *affirmative form*, the verb **to be** is used in the *present simple* as an auxiliary, followed by the main verb in the *past participle form*:

Object	Verb to be	Main verb (past participle)	Complement
Cloud services	are	outsourced	to reduce costs.

To make the simple present passive in the **question form**, the verb **to be** is used in the present simple as an auxiliary at the beginning of the question followed by the object, and then the main verb in the past participle form:

Verb to be	Object	Main verb (past participle)	Complement + ?
Are	these services	delivered	considering the client's needs?

Examples

- *How are cloud services classified?*
- *Sarah, how are these services delivered?*
- *These services are often outsourced.*
- *Managed clouds, which are like private clouds but are owned and managed by the customer himself.*

Learning Points

Understanding the concepts of public clouds, private clouds, hybrid clouds and managed clouds

Cloud computing services can be classified into four types:

Public Clouds

This type of service is offered to multiple users at the same time. The service is not designed with a particular client in mind.

Private Clouds

It is a product specially designed for organizations, which are looking for the benefits of cloud services, but need to offer customized services and have control over them.

Hybrid Clouds

Some organizations have both public and private cloud services, depending on the type of information they handle. The public might have free access to certain content, but some sensitive data would be stored under strict security protocols and have restricted access.

Managed Clouds

This type of cloud service is similar to private clouds. The main difference is that the customer owns and manages the computing services.
